ACKNOWLEDGEMENT

First we express our heartiest thanks and gratefulness to ALMIGHTY ALLAH for His divine blessing makes us possible to complete the final year project successfully. We really grateful to Dr. Asfandyar, Head of Department in Institute of computer science and information technology, The University Of Agriculture Peshawar, Deep Knowledge & keen interest of our supervisor in the field of ONLINE E-COMMERCE STORE (Ezy-E-Buy) to carry out this project. His endless patience, scholarly guidance, continual encouragement, constant and energetic supervision, constructive criticism, valuable advice, reading many inferior draft and correcting them at all stage have made it possible to complete this project. We would like to express our heartiest gratitude to faculty member and the staff of Institute of computer science and information technology, The University Of Agriculture Peshawar, We would like to thank our entire course mate in the University, who took part in this discuss while completing the course work. Finally, we must acknowledge with due respect the constant support and patients of our parents.

ABSTRACT

EZY-E-BUY is a web-based E-Commerce Store developed to provide users with a convenient platform for browsing and purchasing products online. The system is designed to allow customers to view available products, search for products, add items to a shopping cart, update cart information, and proceed to checkout. It also provides an administrator interface through which products, customers, prices, and other store-related information can be managed.

The system was developed using HTML5, CSS3, PHP, JavaScript, and MySQL. PHP is used to provide dynamic functionality and connect the web application with the database, while MySQL is used to store and manage product and customer information. XAMPP and PHPMyAdmin were used as supporting development and database management tools.

The project provides separate customer and administrator interfaces. Customers can browse products, manage their shopping cart, provide their information, and place orders. Administrators can manage products and customer information and maintain the overall operation of the online store. The system was also tested using system testing and functional testing, including positive and negative testing, to verify that its main functions operate correctly.

The project demonstrates how web technologies can be used to develop an online shopping platform that provides customers with easier access to products while giving administrators tools to manage the store efficiently.

CHAPTER-I

INTRODUCTION

E-commerce (electronic commerce or EC) is the buying and selling of goods and services, or the transmitting of funds or data, over an electronic network, primarily the internet. These business transactions occur either as business-to-business, business-to- consumer, consumer-to-consumer or consumer-to-business.

E-commerce store have become part of our daily lives. Technological advancement has made it possible for people to sit in the convenience of their homes and still shop online without going to a physical shop. Africans have also joined the trend of e-commerce business, so this project is meant to design an E Commerce store so that the People in Pakistan will be able to purchase their goods and services online.

This project is mainly divided into two main categories: The Administrators and the Customers/Users.the store manager and the staff members operate as the administrators. They can add, edit, update products or, delete products thus they able to change the names of products, change prices and, add or remove products. The customer can search for products selection, update the cart, remove products from the cart and check out from the shop. The customer is also able to update his information such as names, address and other data. This thesis contains seven chapters to explain the project. The first chapter defines the tools and technology used for the project, and the second chapter describes the application and description of the process. The third chapter represents the MVC layout, the fourth defines the database and the fifth chapter explains the implementation process and the sixth chapter describes the testing of the shop and its feature the seven chapter describes the conclusion of the whole project.

1.1 Tools and Technologies

These are the necessary tools and materials needed to build the website both the front-end and the back-end. These include software and open source materials.

Html/Html5

HTML means Hypertext Markup Language. This language is used in creating web pages. This language also supports other languages such CSS, PHP, JAVASCRIPT, etc. in creating interactive and responsive pages on the pages. HTML5 is just an updated version of the HTML. It supports new features, new attributes, new HTML elements, full CSS3 support, video and audio, 2D/3D graphics that help users and also help web developers to create new features easily on the website The structure of HTML5 is shown in Figure 1.1.

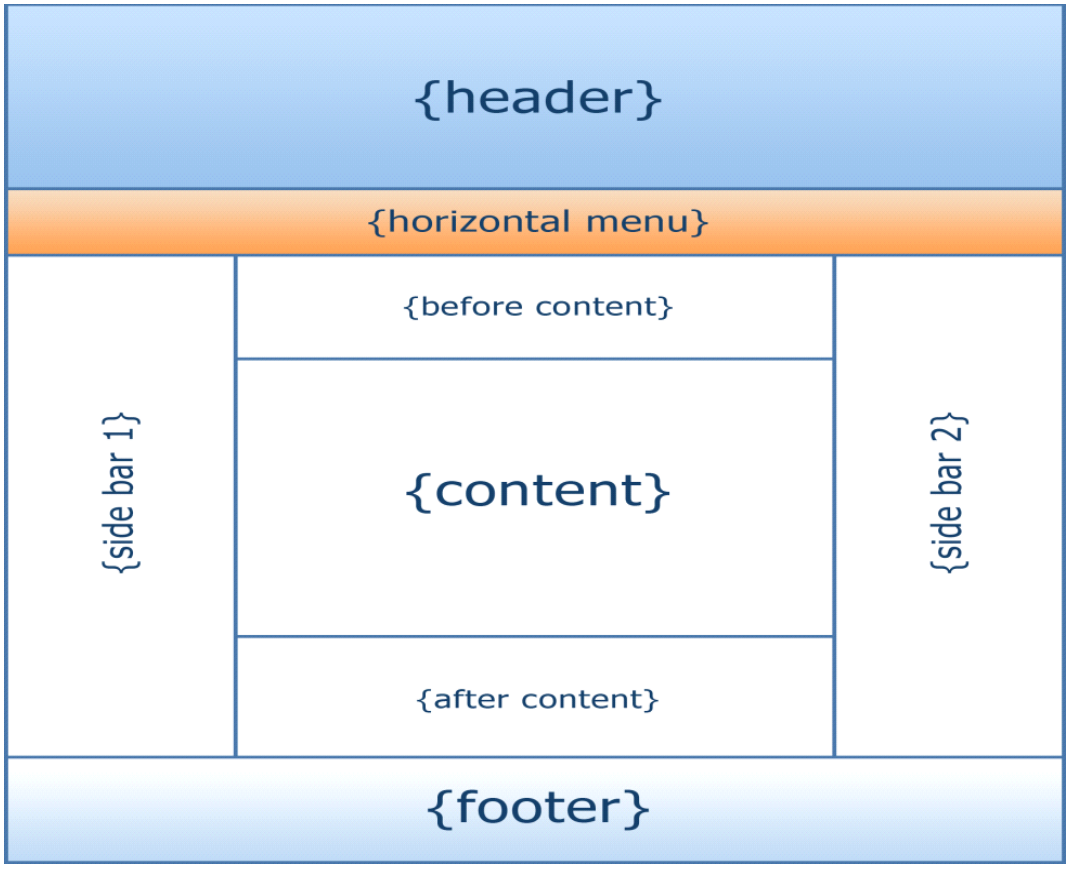

Figure 1.1 The structure of the Html/Html5 webpage/11/

1.2 PHP

PHP is a server-side scripting language that is used to develop Static websites or Dynamic websites or Web applications. It is designed for web development to implement dynamic web pages and can be embedded into HTML for it to be displayed Figure 1.2 demostrates how the web server operates./2/

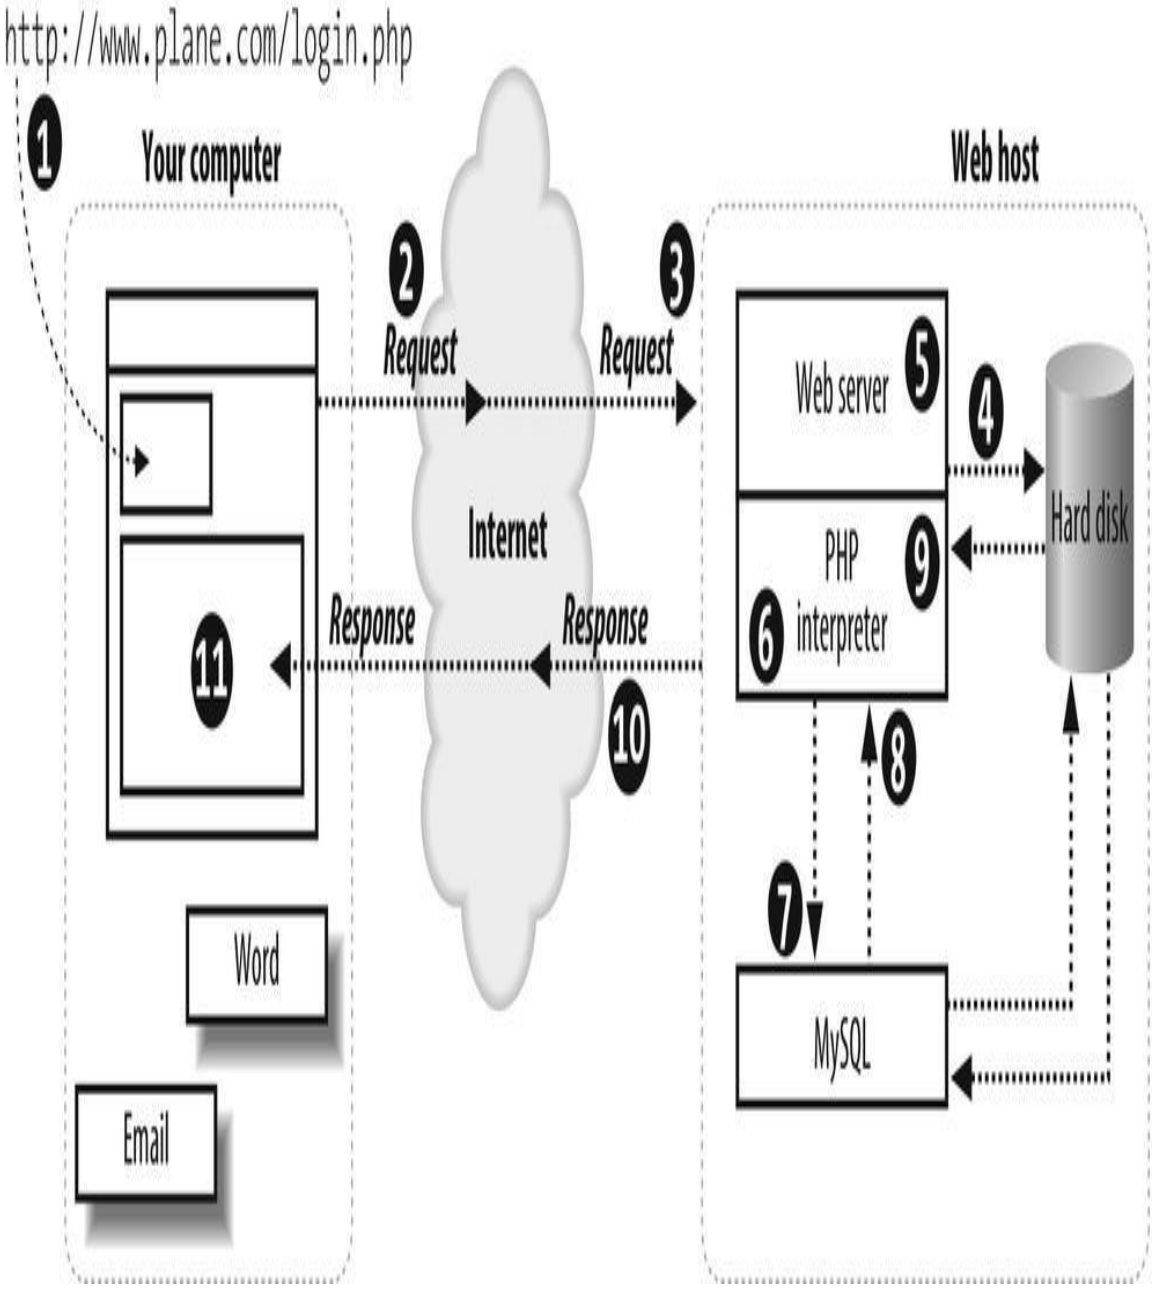

Figure 1.2 Demonstrating how the web server Operates using PHP/12/

1.3 CSS3

CSS is simply referred to as Cascading Style Sheets.CSS is used to define styles for web pages, including the design, layout, and variations in the display for different de- vices and screen sizes./3/

```
<! DOCTYPE html>
<html lang = "en-US">
 <head>
 <meta charset = "UTF-8">
 <link rel = "stylesheet"  type = "text/css"  href =
"myStyle.css" />
 </head>
```

HTML tag you want to modify the property you want to change the value you want the property to take

Example:

p{text-align: center; color: black;

font-family: arial}

CSS can be used in a separate style sheet or used in the webpage

Figure 1.3 CSS code style

1.4 JAVASCRIPT

Java script is a high-level language which could be used independently or inculcated into the webpage. It can be used to, handle requests and responses and also add dynamic behavior and also store information on a website./4/

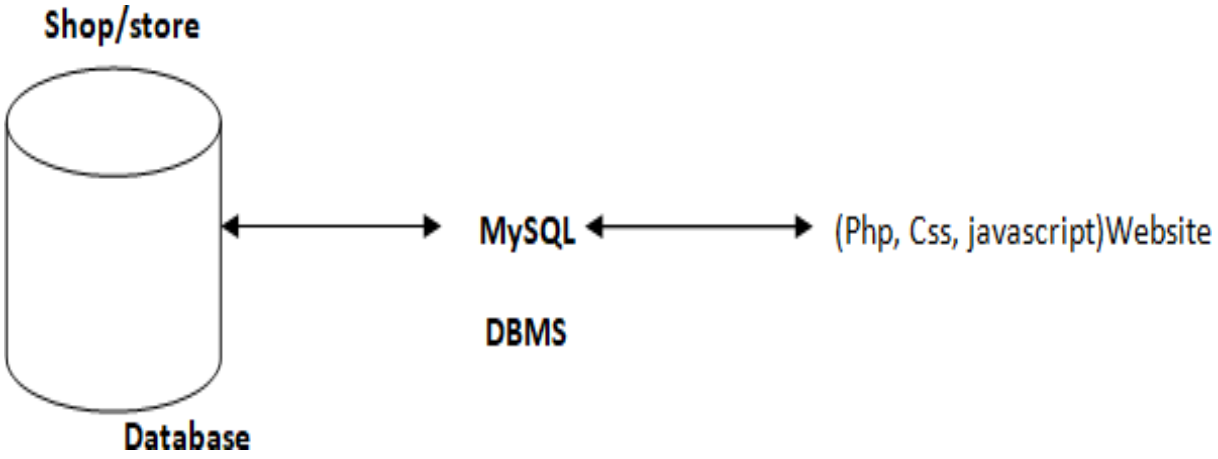

<script ="javascript" type="text/javascript">

JavaScript code

</script>

Figure 1.4 Java Script

1.5 MySQL

MySQL is a free source database system, and it enables the cost-effective delivery of reliable and a high-performance and scalable Web-based and embedded database applications. It is a relational database system (RDBMS). It is a high performing program and scalable to meet the demands of users and data. MySQL is written in C and C++, so it is compatible with most of the operating systems available around the world./5/

Figure 1.5 A diagram showing the concept of MySQL

1.7 XAMPP

XAMPP is an integrated development surrounding, which incorporates Apache HTTP Server, MySQL Database, and PHP, Mercury, PERL or Python on a home Windows- based computer. Apache is a free web server. MySQL is an open source database.

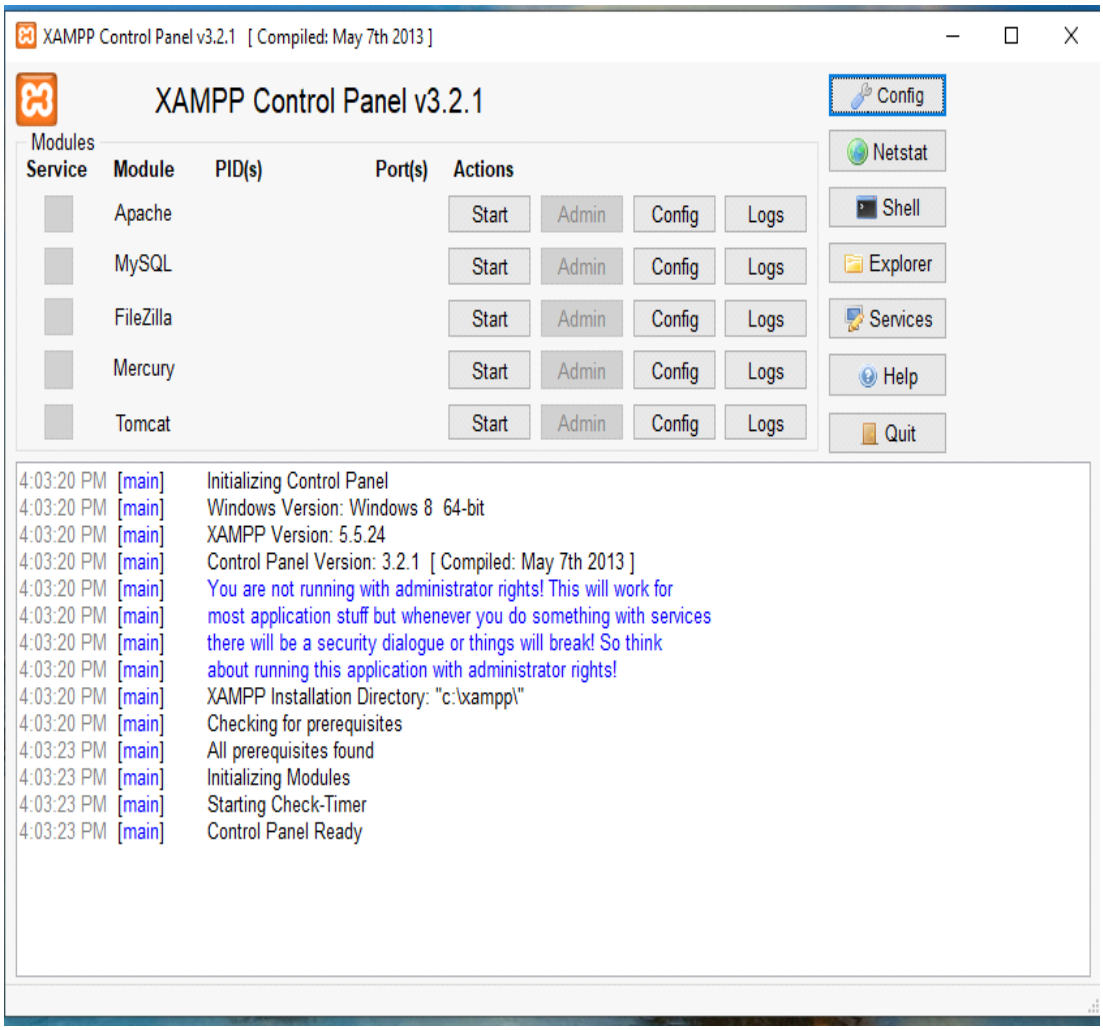

Figure 1.6 XAMPP

1.8 PHP MyAdmin

PHP My Admin is a free and open source MySQL management program application written in PHP and was first launched in 1998 under the GNU preferred Public License. It is cross-platform help for the essential working structures and helps management of more than one servers. It supports most MySQL capabilities and has an intuitive net interface. It additionally has supports developing PDF graphics of data-base layout, importing information from CSV and SQL formats as well as exporting records to various codecs such as SQL, XML, PDF and, CSV./9/

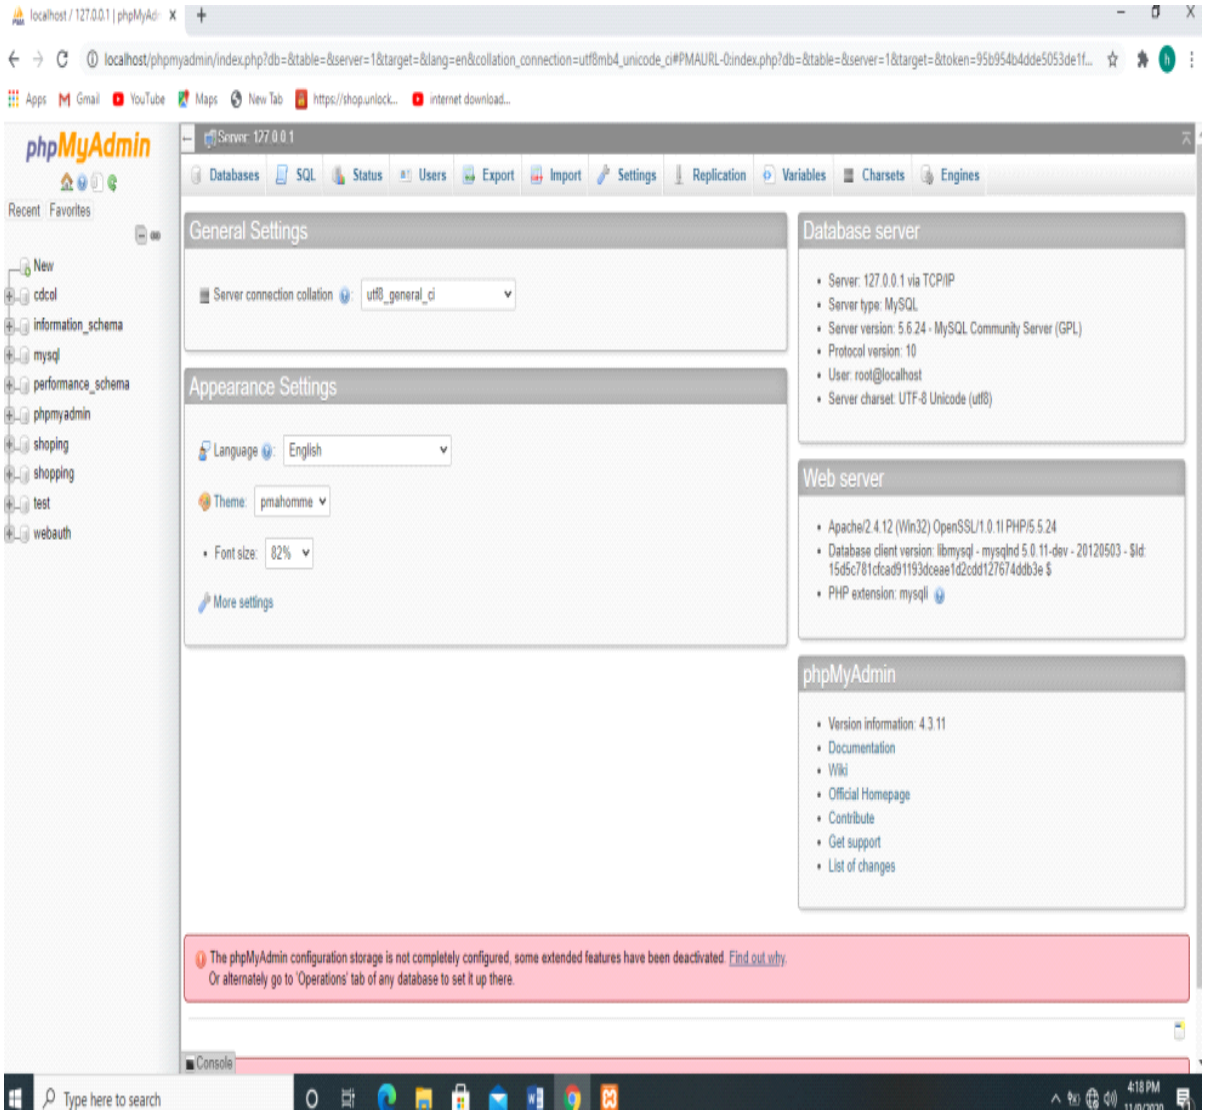

Figure 1.7 PHPMyAdmin

CHAPTER-II

WEBSITE AND DESCRIPTION

2.1 Overview of the Various Parts

This project has several parts to it, but the most essential are three listed in Table 2.1.

Table 2.1 The overview of the three major parts of the shop

Administrators	Customers	
Access to database	Can contact administrator	
Can add products	Can add to cart	
Can edit products	Can edit product in carts	
Can view products	Can checkout	
Can delete products from customers cart	Can order product through contact	

2.2 Administrators Detailed Attribute

Admin register

The administrator dont needs to be regestered before going to access to Database.

Admin login

The admin can access to database in and can view, add products, manage customers.

Admin Edit

The Admin can make changes to the shop such as delete customers, add a customer or, upload new products.

ManageCustomer

The administrator has the authority to delete or add a customer.

2.3 Customer DetailedAttribute

Signup

The Customer don’t need to be registered. He/she can order there product by email at administrator through contact us.

View

The customer can see all the products in the catalog and able to look at the products and some features on the homepage.

Edit

The customer can make changes to their product and there details on contact us page.

Update Cart

This refers to putting or removing products from a shopping cart.

Figure 2.1 is the use case diagram of the shop. One can see the essential attributes associated with both Administrator and Customers/Users.

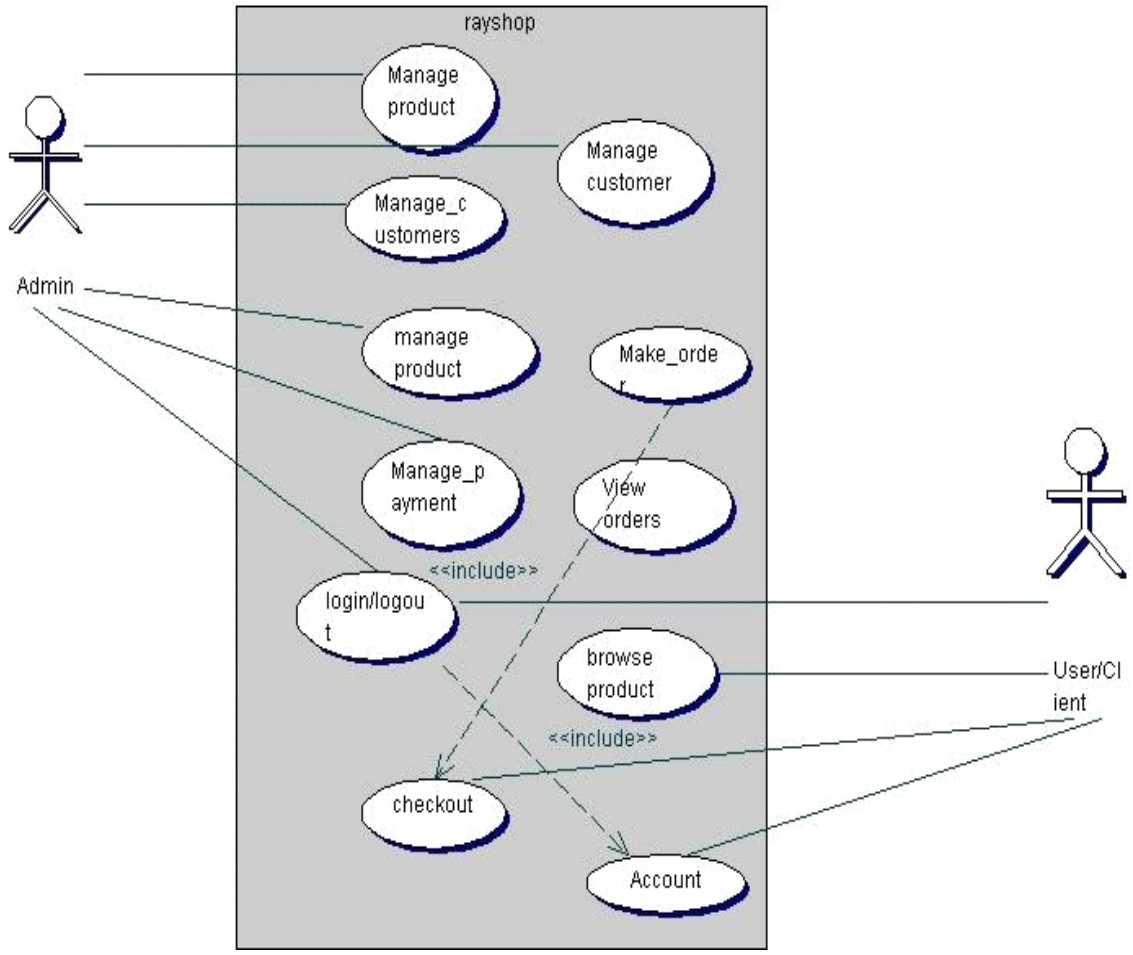

Figure 2.1 Use case diagram of the shop

2.4 The Various ManagementUnit

The Administrators play the management role. They make sure everything in the shop runs smoothly.

CHAPTER-III

MVC UNIT OF SHOPPING CART

The three parts of the MVC software structure perform the following:

View– shows the interface that the person sees(usually, a webpage). The view additives provide records to the user and moves to the Controller for manipulating data.

Model– defines the statistics for the software(typically, the facts is sav admin a database(DB)). The controller provides the interface between the View and the model.

3.1 Back-endModulelayout

This includes Units such as products, brand, category, orders and customer management modules.

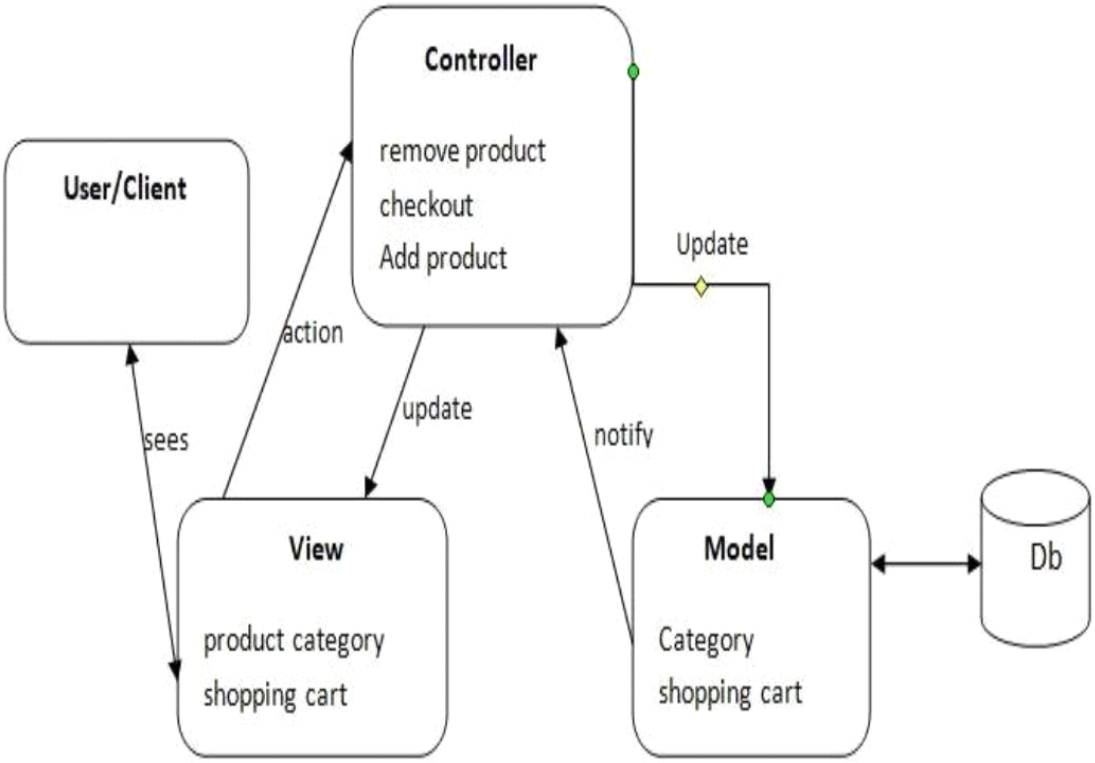

Figure3.1Showsthe diagram of theback-end module

The back-end module/Unit is used to manage the back end of the shop. This is only available to the administrators. They can manipulate the shop to suit the conditions they have set for the shop. They also make sure that customers have a good experience when visiting the shop by updating products, deleting products, executing orders to ware-houses, and managing customers.

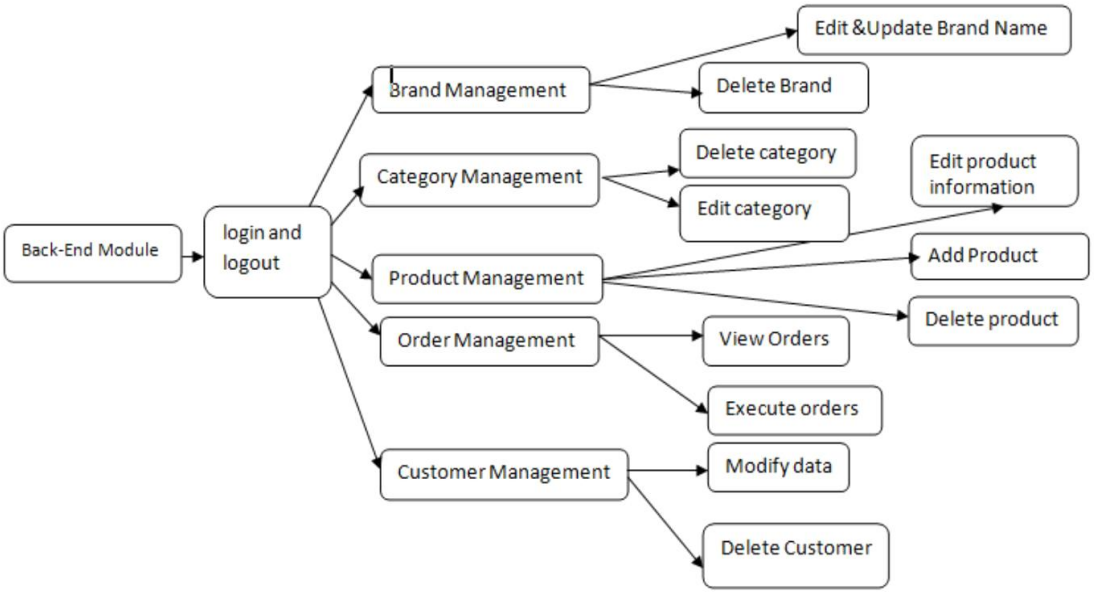

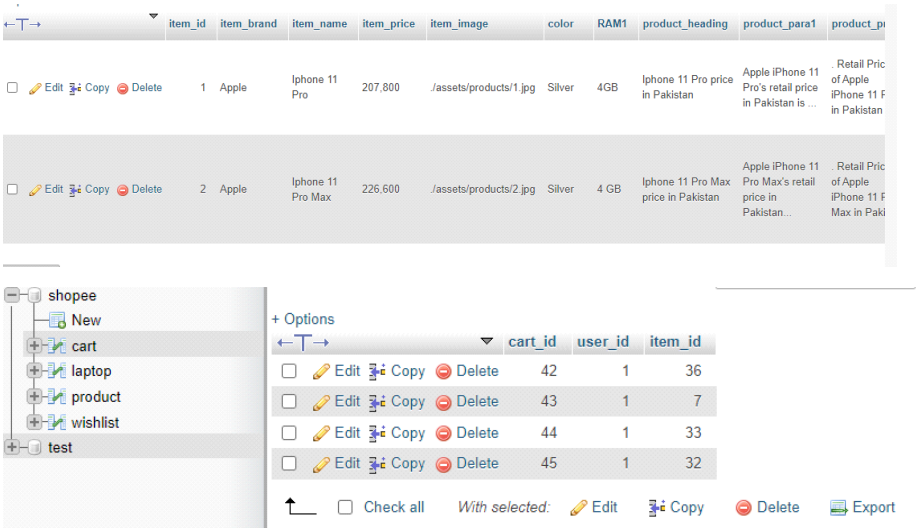

Figure 3.2Back-end system management diagram

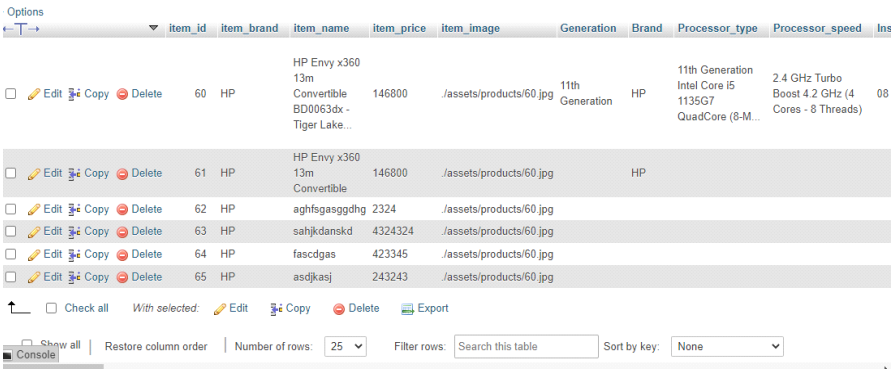

CHAPTER-IV

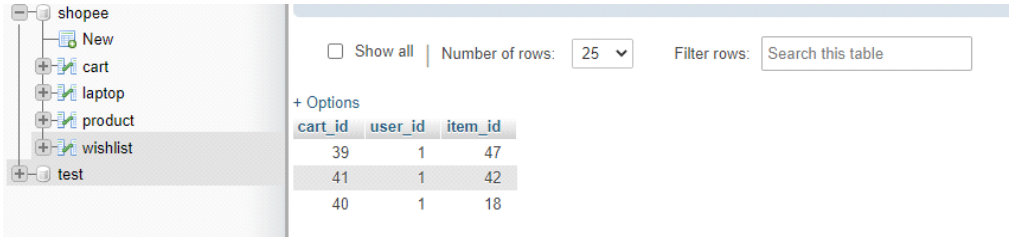

DATABASE GUI

4.1 Database

My SQL database is used to save software at a for this project. My SQL is relational database management, and it is free of charge. All of the information is kept in a select table and every table has particular range columns and rows. It has eight tables named as Cart, Product, Laptop, Wishlist.

. **Figure 4.1: database tables**

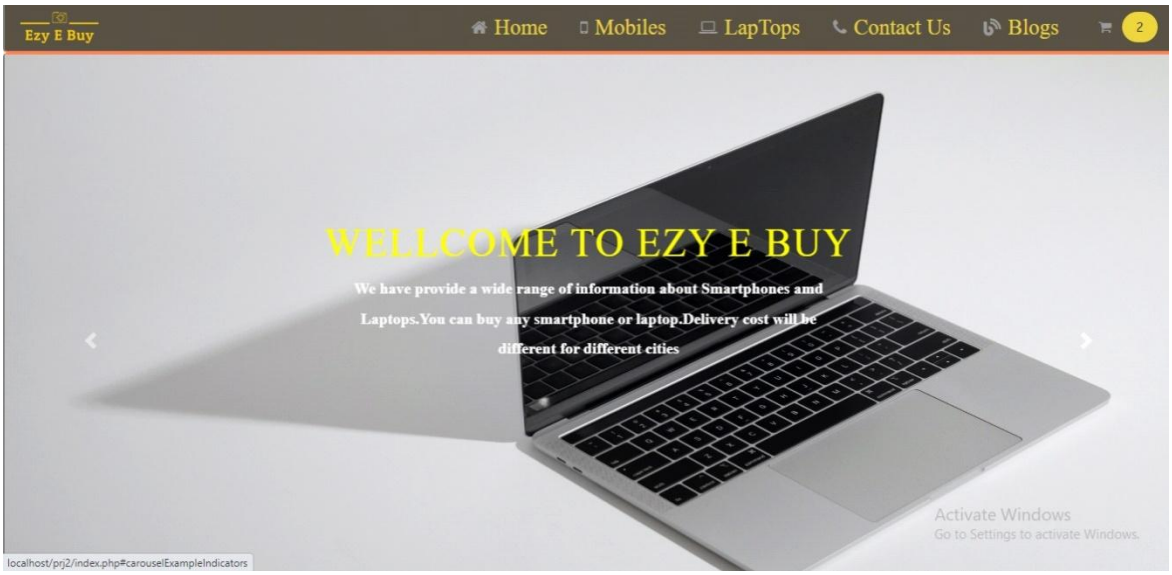

The ER-diagram has a specific name and it consists of columns and rows. For each table, we need to mark at the least one area as a primary key. The primary key is usually specified in a particular table. The table "product" is created to store all the Mobile product information. It consists of many distinctive fields referred to as columns to shop item_id, item_name, item_brand, and item_price. "item_ id" is the primary KEY.

	item_id	item_brand	item_name	item_price	item_image	color	RAM1	product_heading	product_para1	product_p

Edit Copy Delete	2	Apple	Iphone 11 Pro Max	226,600	./assets/products/2.jpg	Silver	4 GB	Iphone 11 Pro Max price in Pakistan	Apple iPhone 11 Pro Max's retail price in Pakistan...	. Retail Pric of Apple iPhone 11 F Max in Paki

Figure 4.2 Database table showing various products

4.2 Customer Interface layout

Consumer refers to customers and non-customers. These are individuals who visit the shop either to buy products or to browse. There are two categories of interfaces namely the Consumer and the Administrator interface. The administrator has higher authority over the customer in the shop. The admin can edit, replace a product and, manipulate data in the shop. The customer can browse a product, add a product to the cart, change personal information, check shopping history and checkout or logout. The User, on the other hand, can only browse and add a product to cart. The homepage or interface is the index page of the shop so can be accessed when the address is typed into a browser. The webpage has products images, names, prices, product categories and product brands. The webpage has a registration link, login link, cart, company contact information.

4.2.6 Payment

This is the final stage of the shopping experience. The customer who is satisfied with there choice of product In Intial they will pay in Cash But later on with update in website price will be paid with ATM.It is the best method to pay at your door step.

Figure

4.10 Checkout

5.3Management Interface design

manage interface is Image result for what is Administration Interface design Interface administration could be a prepare to help in

controlling item improvement when endeavors are separated among parties (e.g., Government, temporary workers, topographically assorted specialized groups, etc.) and/or to characterize and keep up compliance among the items that ought to interoperate.

The customer must enter his username, email, and password. The html5 will check if all the fields are filled. If field conditions are not met the data will be deleted; otherwise, his mail will be send to administrator gmail.

Identify the characteristics of the interfaces (physical, electrical, mechanical, human, etc.);

Ensure interface compatibility at all defined interfaces by using a process documented and approved by the project;

Strictly control all of the interface processes during design, construction, operation, etc.;

Identify lower level products to be assembled and integrated (from the Product Transition Process);

Identify assembly drawings or other documentation that show the complete configuration of the product being integrated, a parts list, and any assembly instructions (e.g., torque requirements for fasteners);

Identify end-product, design-definition-specified requirements (specifications), and configuration documentation for the applicable work breakdown structure model, including interface specifications, in the form appropriate to satisfy the product life cycle phase success criteria (from the Configuration Management Process); and

Identify product integration-enabling products (from existing resources or the Product Transition Process for enabling product realization).

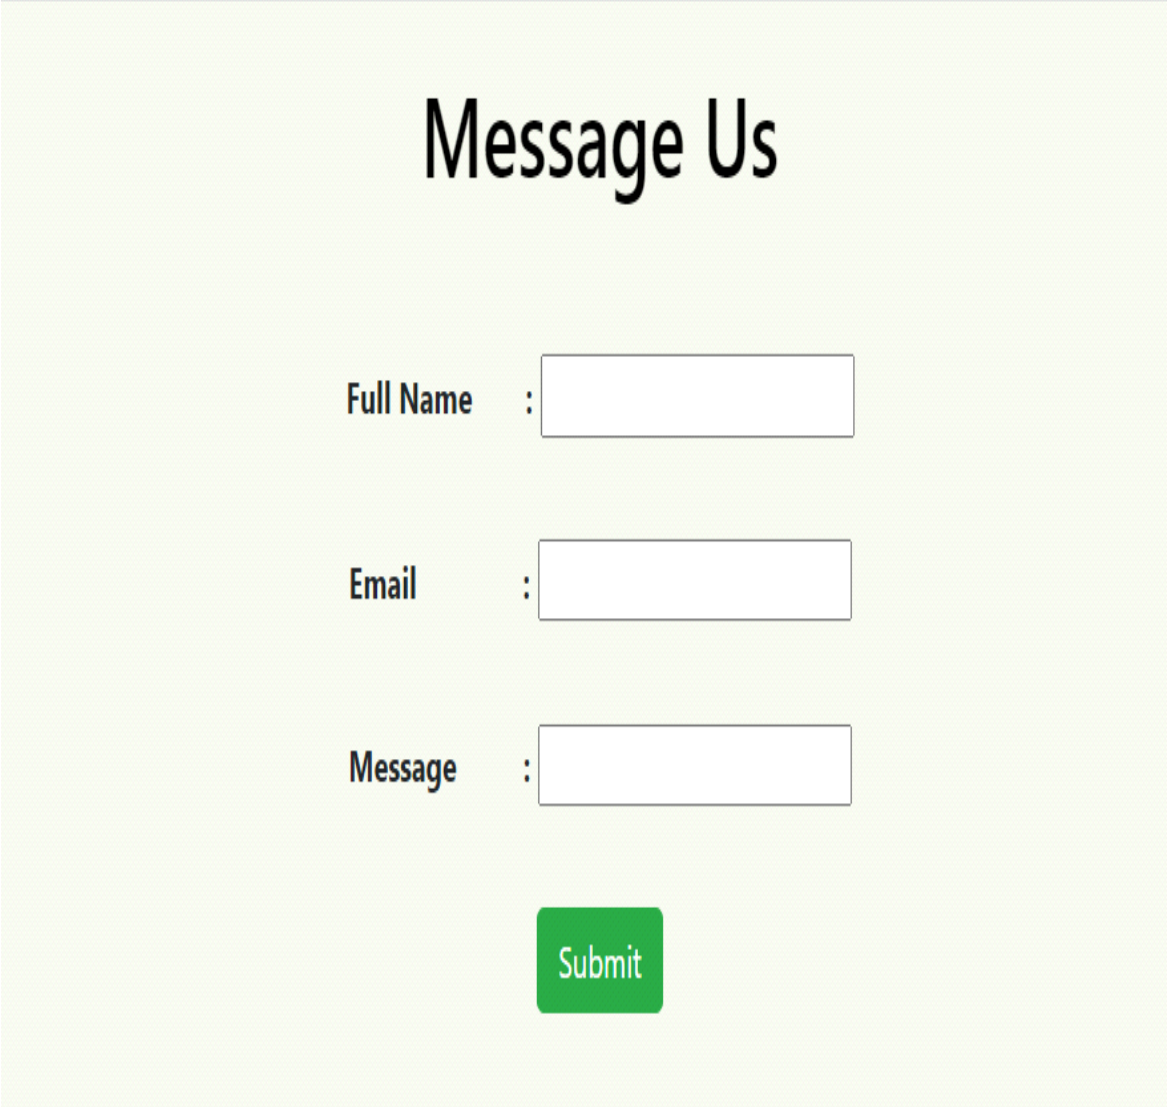

Figure 4.11 Customer interaction

CHAPTER- 5

IMPLEMENTATION

This chapter contains the functions for implementation.

5.1 Description

The created Ezy-E-Buy based entirelyon free source applications and with the intention to cut cost. All of the functionalities need to be carried out in an orderly manner. The customer or user interfaces are critical because the administrator interface will be used to manage the activities on the customer interface. The technologies used for the project is HTML5, CSS3,PHP, and MySQL.

5.2 Implementation of functions

Customer interface and administrator interface are the main interfaces created in this project. With the customer and admins interface, I used HTML5 andCSS3. The HTML5 was used to create the structure of the page whiles the CSS was used to style the page. PHP is a dynamic language, so used it to automatically fetch information from the database into the web pages without re writing every data by hand.

5.3 Basic HTML of the shop

```
<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="UTF-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <title>MobiLap</title>

    <!-----------------Linking bootstrap---------------->
    <link rel="stylesheet" type="text/css" href="http://localhost/mobishop/bootstrap/css/bootstrap.min.css">

    <!--------connecting css file-------->
    <link rel="stylesheet" type="text/css" href="http://localhost/mobishop/css/custom.css">

    <!------------linking animation  link----------->
    <link href="https://cdnjs.cloudflare.com/ajax/libs/animate.css/3.7.2/animate.min.css" rel="stylesheet">

    <!------------------->
    <link rel="stylesheet" type="text/css" href="fa/css/all.min.css">

     <!---------------Font awesome link------------------------->
    <link rel="stylesheet" type="text/css" href="https://stackpath.bootstrapcdn.com/font-awesome/4.7.0/css/
    font-awesome.min.css">

     <!-- font awesome icons -->
    <link rel="stylesheet" href="https://cdnjs.cloudflare.com/ajax/libs/font-awesome/5.13.0/css/all.min.css"
    integrity="sha256-h20CPZ0QyXlBuAw7A+KluUYx/3pK+c7lYEpqLTlxjYQ=" crossorigin="anonymous" />
```

The fundamental part of the HTML5

This is the basic HTML of the shop. PHP is used to enclose the file because the project will use PHP in most of the project otherwise the system will fail to work with the database. The DOCTYPE declaration is a simple indication that the page is written in HTML5.The content of the page shows the title, links, logos, and the CSS used in styling the webpage.

5.4 Basic CSS ofthe shop

```
@import url("https://fonts.googleapis.com/css2?family=Baloo+Thambi+2&family=Raleway&family=Rubik&display=swap");
/*             Sass Template            */
/*  global classes  */
button, button:focus {
    outline: none !important;
    box-shadow: none !important;
}

/* typography classes */
.font-baloo {
    font-family: "Baloo Thambi 2", cursive;
}

.font-rale {
    font-family: "Raleway", cursive;
}

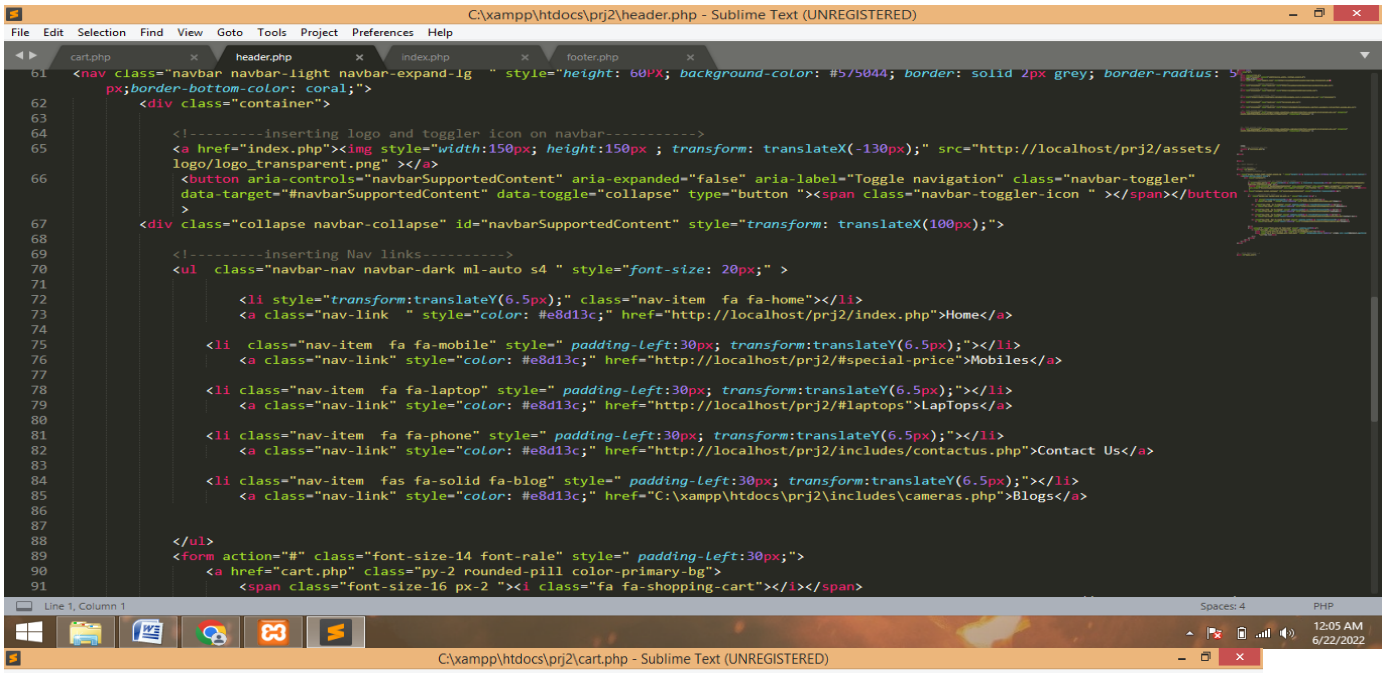

.font-rubik {
    font-family: "Rubik", cursive;
}

.font-size-12 {
    font-size: 12px;
}

.font-size-14 {
    font-size: 14px;
}

.font-size-16 {
    font-size: 16px;
}

.font-size-20 {
    font-size: 20px;
```

CHAPTER-VI

PHYSICAL DATABASE

The main theme of the physical database architecture/designing is to show abstract explanation so information into specific requirements to ring and accessing data. As we all know that DB design needs the user requests/requirements for making a database style. Physical database style contains tables that are specified your necessities. Within the specific project, there is a completely different kind of table we are using. The tables were created for a specific project which is given below that sometimes known as project requirements.

6.1 Physical Database Design Tables

The following are the physical tables of the database of the online attendance system it specifies the name, types, length etc.

CHAPTER-VII

TESTING

The key purpose of system testing is to test the websites and apps from aspects. In system testing, we run the application to confirm, if there is an error in the system. In such testing, codes that are written for apps and sites are tested. These techniques are used to check either the coding, which is developed is working on Personal computers and Android devices. There is more than one method to test such systems which will be discussed in this chapter.

7.1 System Testing

System testing is a process in which different type of tests are performed to confirm if there is any error or fault in the system. System testing is performed before and later a system is being developed. The primary purpose of such testing is to confirm if all the requirements are fully converted to code or not. In case of successful transformation, we need to check the results if it's working properly or not? On the result soft his testing, we can validate the application.

7.2 Functional Testing

As our application is working in our daily lives. So It must be tested on functional testing technique. Functional testing confirms whether the website is working properly as per standards and its specifications. Functional testing actually starts in the implementation phase of the system, the most important and critical section for the success of the system.

Functional testing is divided into two categories

7.3 Positive Functional Testing

In this type of testing the output is totally depends on the input provided. If the data provided is accurate the result will definitely as per our expectations.

7.4 Negative Functional Testing

It is that type of testing in which the application checked with incorrect input and undesired operating scenario.

CHAPTER-VIII

CONCLUSION

The internet has opened so many opportunities for doing business online, and e-commerce is one of the most popular ones. Not only does it require low investment, it actually is a type of business that does not require a full-time commitment, especially if you are selling a limited number of products. You just make an online presence and promote the business here and there using both free and paid methods. However, as each business, it has its positive and negative sides. If you want to achieve success, you will have to create an organized strategy which is based on realistic goals and comprehensive analysis of the market.

8.1 Advantages and Disadvantages

Website maintenance, processing orders, customer services and website analytics are all the tasks you will have to handle once the store is live and running, but this is not a 9 to 5 work. You do not have to be there all the time, sitting by your desk, bound by the fixed working hours.

Instead, e-commerce offers lots of flexibility for the merchants, and this is one of the main characteristics that bring this profession into the list of top desired ones for people nowadays. It brings a level of freedom to manage your own time and work flexible hours, which is a priceless thing to have in life.

Even though this is an advantage a lot of work professionals can only dream of, running an e-commerce business also requires being online and available all the time. You always have to monitor the notifications and be ready to help customers. Since e-commerce is not restricted by location or limited work hours, you can accept the orders from anywhere at any time. For you, this means that keeping an eye on the activity and customer support emails is going to be a requirement all the time. And this is important if you want to have a successful business because good customer support is one of the best ways to attract and keep customers loyal.

8.2 Consistency and Dedication

Running an e-commerce business requires a lot of consistency and dedication from your end to create a successful business. You always need to keep it professional and use an approach that is

in accordance with your business goals. The first part is the initial one where you are focused on planning and setting up the online business. Besides planning, which will actually be one of the main tasks, you will also have to focus on website development, product page creation, and optimization, etc. Before you make products and services available to the customers, you will also have to do a lot of testing of the website. You should especially focus on testing of the integrations such as checkout page and payment gateways. It is crucial that everything works fine on your website because any loading error will probably turn away the potential customers.

The second part of the work is done once the store is published online and these tasks are focused on website maintenance, product promotion, and customer service. Consistency in the approach you use is necessary here as well because each social media post, each newsletter, and each ad represents your company and add up to the public image you create for the business you run. If you want to be taken seriously, if you want to build a respectable online business, you have to be professional and dedicated to representing your company in the best possible way. After all, every online activity will be scrutinized by potential customers, and you do not want to give them any reason to doubt your credibility.

8.3 E-Commerce and Online Marketing

Throughout the e book, the most important tasks and goals of an e-commerce website have been highlighted. Online marketing, or one of the segments of online marketing, is mentioned on several occasions. This is because having an e-commerce business requires the usage of online marketing techniques and strategies.

You will need SEO to optimize your website. You will have to learn about website analytics to be able to analyze and improve the performance of your website. Promotion of the e-commerce website cannot be done without search engine marketing, social media marketing, email marketing and even affiliate marketing.

This means that e-commerce is a part of the system. It is an online business, and as such, it is dependent on the online marketing strategies that can bring success. To make the most out of these strategies and to be sure you are doing all that is possible to promote your e-commerce business, you should explore the topic of online marketing in more details. The focus of this e

book was to show you different aspects of running an e-commerce business, and online marketing and its types are mentioned to a limited extent, which does not mean you should stop there.

For example, if you have learned that email marketing can help you with promoting your e-commerce, find relevant resources on email marketing and then explore strategies that can be implemented to your business.

Finally, it is necessary to highlight the influence of mobile devices once again. There is no doubt that mobile user experience is one of the primary goals you need to think as the statistics in favor of mobile users are keep growing. This affects the creation of a sub-sector called m-commerce. It is left to be seen how this trend will affect selling online, but what is evident now is that mobile users comprise a significant portion of overall traffic, and as such, they cannot be ignored. You must not neglect the traffic that could help you increase the number of buyers, because, after all, that is what you are trying to do with various promotion strategies.

The bottom line is that the internet changed the idea of shopping forever. So many limitations are now extinct because you can buy goods from anywhere in the world. Even so, some boundaries are part of this online experience such as inability to touch and feel the product before it is delivered. All of this changes the way buyers think about shopping, and this is something you, as a business owner, need to think about.

This industry is all about consumers. Understanding their needs and expectations, together with defining your business goals and strategies is going to help you with running a successful e-commerce business. Have in mind that the online world is a very dynamic environment, and to be on top of your game, you need to make industry research and website analysis your top priorities.
